GALAXIES

Islands of stars

A galaxy is a huge system of stars, gas, dust and dark matter held together by gravity. The observable universe holds hundreds of billions of them, possibly trillions. Pick a type to compare.

Spiral | Elliptical | Lenticular | Irregular

Spiral galaxies

Flat discs with curving arms

A bright central bulge sits inside a thin, rotating disc with arms where new stars are born. Many have a bar of stars through the middle. Our own Milky Way is a barred spiral.

SOLAR SYSTEM

Eight worlds, one star

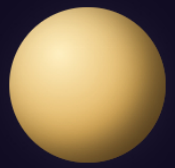

Scroll sideways through the planets, from the one nearest the Sun to the farthest.

Mercury

Smallest planet

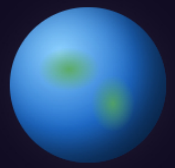

The closest planet to the Sun. It has almost no atmosphere, so days are scorching and nights are freezing.

Venus

Hottest planet

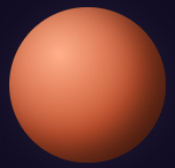

A thick carbon dioxide atmosphere traps heat, so the surface is hot enough to melt lead. It also spins backward compared with most planets.

Earth

Only known life

The only place we know has life. Liquid water covers most of its surface, and one large Moon helps steady its tilt.

Mars

The red planet

Home to Olympus the tallest volcan in the solar syste river beds show t once flowed here.

farthest.
